Scripts and Modules

Exercises

M	1	Д	Д	k	5
v	v	<u>_</u>	<u>_</u>	r\	

Prior to attempting these exercises ensure you have read the lecture notes and/or viewed the video, and followed the practical. You may wish to use the Python interpreter in interactive mode to help work out the solutions to some of the questions.

Download and store this document within your own filespace, so the contents can be edited. You will be able to refer to it during the test in Week 6.

Enter your answers directly into the highlighted boxes.

For more information about the module delivery, assessment and feedback please refer to the module within the MyBeckett portal.

When a Python program is stored within a text file (i.e. a <i>script</i>), what suffix should be used for the filename?
Answer:
.py
Is it necessary to use a special Integrated Development Environment (IDE) to write Python code in text files?
Answer:
No it is not necessary to use a special Integrated Development Environment (IDE) to write Python code in text files.
When a <i>script</i> is executed from a file, are the results of evaluating expressions automatically displayed on the screen without the need of a print() function call?
Answer:
Yes, the results of evaluating expressions in a script are not automatically displayed on the screen unless you explicitly use a print() function or some other output method.
What command would need to be typed in an operating system terminal window in order to execute a Python script called PrintNames.py?
Answer:
python PrintNames.py
What command would need to be typed in a terminal in order to pass the values "John", "Eric", "Graham" as command line arguments to the PrintNames.py script?
Answor

python PrintNames.py "John" "Eric" "Graham"

When a Python script wishes to access *command line arguments*, what **module** needs to be imported?

Answer:

sys module		

What is the data-type of the sys.argv variable?

Answer:

list				

What is stored within the first element of the sys.argv variable?

Answer:

```
name of the Python script
```

Use a text editor to write the *script* called PrintNames.py. This should display any *command line arguments* that were passed during execution.

Once complete, place your solution in the answer box below.

Answer:

```
PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS SEARCH ERROR

[Running] python -u "c:\Users\diksh\OneDrive\Desktop\FOCP\Week 5\index.py"

No command-line arguments were passed.

[Done] exited with code=0 in 0.13 seconds
```

Improve the solution so it uses an if statement to check that at least one name was passed, or otherwise print a message saying "no names provided". Place your improved solution in the answer box below.

Answer:

```
[Running] python -u "c:\Users\diksh\OneDrive\Desktop\FOCP\Week 5\index.py"
No names provided.

[Done] exited with code=0 in 0.081 seconds
```

When using an import statement it is possible to provide an alias that can be used as an alternative name to access module content. Write an import statement that imports the whole of the sys module, and renames it to my system. Answer: import sys as my_system Write a from..import statement that imports only the math.floor function, and renames it to lower Answer: from math import floor as lower What is stored in a symbol-table? Answer: Variables, functions, classes etc Why is the following type of import statement generally not recommended? from math import * Answer: From math import * is generally not recommended for the following reasons: 1. Namespace Pollution 2. Reduced Readability 3. Poor Namespace Management 4. Performance issues When working in interactive-mode what convenient function can be used to list all names defined within a module? Answer: dir()

What is the value stored within the sys.path variable used for?
Answer:
To search paths
When a program is being executed as a <i>script</i> what value is assigned to the special variablename?
Anguar
Answer:main
What value is assigned to thename variable when a program has been imported as a
module?
A
Answer:
name = 'mymodule'
Why is it useful for a program to be able to detect whether it is running as a <i>script</i> , or
whether it has been imported as a module?
Answer:
It can be useful to only execute some part of code while it run as script and skip if it is called
imported
